rent; *see Tab.* 20. *Fig.* 2. The other lobes distinct for three or four of the first pairs, near the extremity become confluent, terminating the second leaf in a crenated point. The lobes on one or two of the largest second leaves are irregularly crenated; lowest pair of the second leaves wants the short decurrent lobe at the base.

Seed vessels in small dots on the margins of the lobes near their divisions, two, three, or four on each side, at first white, afterwards of a pale brown, lastly black.

Wood Polipody grows in the moist part of shadowy woods, in the West Riding of Yorkshire in many places; in a little wood in Soyland, just by the brook below Kebroyd-Mill plentifully; and in a little shadowy range of wood ground near the brook above Oldhouse-Mill, Norland, two miles from Halifax.

The whole plant is of a dark fuscous green; whilst young a little downy, and feels soft to the touch; to the lower part of the rib adhere a few chaffy pale brown scales.

POLIPODIUM
